

The April 2020 local production statements are now available for download. Nominations can also be entered for the June 2020 production period. Remember -- June is a six-week production period for any local production meters that have not been switched to calendar reads.

\*\*\*\*\*

You can calculate your June nomination in two steps:

Using your April 2020 local production actuals statement, sort on any meters with on/off dates of 4/1-4/30. These meters have already been switched to calendar month reads and should not be converted for the six-week production period. You can use the total production from these meters as part one of your estimated nomination for June.

The remaining meters with mid-month to mid-month on/off dates - or meters with no on/off dates (paper stations), represent the meters that will produce for six-weeks in June. Use the total production from these meters and convert to a six-week volume (take the total and divide by four and then multiply by six). This total becomes part two of your estimated nomination for June.

Don't forget to adjust for any meters that are transferring to/from your pool in May or June.

The instructions below are the standard options for handling the six-week production period.

\*\*\*\*\*

Each June and November, marketers and end-users with Ohio production will make an election as to how they want their six-week supply volumes handled. The three options are:

- #1: Nominate Ohio production for a six-week production period and use all nominated volumes as supply in that month.
- #2: Nominate Ohio production for a six-week production period, which DEO automatically reduces by 1/3 to reflect only four weeks of production for the month. If you choose this option, DEO will automatically return the other two weeks of nominated volume ratably until the next six-week period. (The extra June production would be ratably returned over the next five months - June through October. The extra November production would be ratably returned over the next seven months - November through May).
- #3: Nominate Ohio production for a six-week production period, which DEO automatically reduces by 1/3 to reflect only four weeks of production for the month. If you choose this option, DEO flexibly returns the other two weeks of nominated volume until the next six-week period subject to monthly caps. (The extra June production would be returned up to 25% over any of the next five months - June through October. The extra November production would be returned up to 20% over any of the next seven months - November through May). If you choose this option, you will need to notify DEO each month to request your return volume. DEO will accept return volume requests during a month's respective reallocation period. Any volumes held using this option must be at zero by the start of the next six-week production period. DEO will monitor return volumes to ensure that they can be at zero by the specified month.

For the June 2020 production period, those marketers or customers with Ohio production will need to make a supply election by May 31. Please send an email to Dina Longo, at dina001@dom.com, indicating your preference. Failure to specify an election by the deadline will result in a default election of Option #1.
